MISSION INTEGRITY CHARTER SUMMARY
INGENUITY LABORATORY, LLC

Adopted: August 22, 2026
Version: 2.1

PURPOSE AND SCOPE

The Mission Integrity Charter protects Ingenuity Laboratory's academic purpose, research integrity, and independence. This summary describes its main principles; the full Charter and executed governing documents control.

The Laboratory's current focus is to support Aaron Suzar's graduate studies at Harvard University's Division of Continuing Education ("Harvard DCE"), develop research and technical skills, conduct preliminary cloud-based research and development, and pursue interdisciplinary study in Biology, Chemistry, Computer Science, Engineering Sciences, Mathematics, and Statistics.

Activities should remain within this focus, fit available time and resources, and avoid materially impairing academic work, research integrity, or independence. This summary sets no numerical resource limits; any such limits should be stated in the full Charter or a written policy.

CORE PRINCIPLES

Academic Primacy. Academic work takes priority. Laboratory activities should support, not materially interfere with, the time and attention required for study.

Strategic and Operational Independence. Research decisions should be guided by evidence and integrity, not inappropriate external pressure or dependence on partners, investors, or sponsors.

Verifiable Rigor. Claims and results should be supported by disciplined inquiry, evidence, testing, validation, and reproducible reasoning.

Resource Discipline. Commitments of time, money, attention, personnel, and infrastructure should be appropriate to the Laboratory's academic and preliminary research focus.

MISSION ALIGNMENT REVIEW

A significant proposed activity should be rejected, deferred, or revised if it would materially:

- Divert time from academic work or research.
- Exceed applicable resource limits or create unmanageable obligations.
- Create premature commercialization or scaling pressure.
- Change research direction without adequate justification.
- Compromise ethical or scientific standards.
- Reduce research, strategic, or operational independence.

Aaron Suzar, as Sole Member, should assess and document whether a significant activity aligns with these principles, subject to the full Charter and governing documents.

SCOPE-CRITICAL ACTIONS

Heightened review applies to significant partnerships or external engagements; major commitments of time, money, personnel, or infrastructure; mergers, acquisitions, or asset sales; fundamental research or ethics changes; and ownership or governance changes that could weaken mission protections.

EXTERNAL ENGAGEMENTS

External relationships should support the Laboratory's purpose, preserve academic primacy and research independence, fit available resources, remain ethical and sustainable, and leave capacity for academic work and preliminary research. An opportunity may be declined if poorly timed, overly demanding, or inconsistent with the Laboratory's current focus.

GOVERNING DOCUMENTS

This summary does not amend the Mission Integrity Charter, Operating Agreement, Members Rights Agreement, or Bylaws, and does not independently establish priority among them. Their effect and any conflicts are governed by their executed terms and applicable law.

AMENDMENTS

Amendments to the Charter are governed by the Charter's terms and applicable governing documents. Any proposed amendment should be reviewed for its effect on academic time, resource limits, academic primacy, independence, and mission-critical decisions.

Ingenuity Laboratory pursues discovery and invention with discipline, independence, and integrity while protecting the academic foundation on which its work depends.
