Mission Integrity Charter Summary

Preamble

The Mission Integrity Charter of Ingenuity Laboratory establishes governing principles protecting the laboratory's academic purpose, strategic independence, and research integrity.

Adopted August 22, 2026, Version 2.1 supersedes the prior Mission Integrity and Investment Governance Charter. The Charter recognizes Ingenuity Laboratory as a **graduate-level academic endeavor** centered on the Founder's studies at Harvard Division of Continuing Education and preliminary cloud-based R&D.

Purpose

No significant activity outside of studies and coursework may be approved unless it:

1. Affirmatively advances the laboratory's mission and core values; or
2. At minimum, does not cause a material adverse effect on them.

This standard prevents mission drift from premature commercialization, excessive scope, external pressure, resource constraints, or commitments distracting from academic study.

Current Phase

Ingenuity Laboratory’s immediate focus:

- Support the Founder's graduate-level academic work
- Develop research and technical skills
- Conduct preliminary cloud-based R&D
- Pursue interdisciplinary inquiry across biology, chemistry, computer science, engineering sciences, mathematics, and statistics
- Build disciplined foundations for future experimentation and invention.

Core Principles

Academic Primacy: The Founder's academic pursuits remain the laboratory's first priority. Activities must support, not undermine, time and attention required for academic development.

Strategic Autonomy: Preserve independence to challenge assumptions, pursue unconventional ideas, and decide based on research integrity rather than external pressure.

Operational Independence: Avoid commitments creating dependence on partners, investors, or sponsors whose interests may conflict with the laboratory's mission.

Verifiable Rigor: Work must be verifiable, reliable, and demonstrable. Claims require disciplined inquiry, evidence, testing, validation, and reproducible reasoning.

Resource Discipline: Limit commitments of time, money, attention, personnel, and infrastructure to activities consistent with academic and preliminary research focus.

Mission Alignment Standard

A proposed action should be rejected, deferred, or revised if it would:

- Divert substantial time from graduate study
- Exceed established resource limits
- Create premature commercialization pressure
- Change fundamental research direction without justification
- Compromise ethical or scientific standards
- Reduce strategic or operational independence
- Create obligations that cannot be responsibly managed
- Encourage scaling before adequate research validation

Scope-Critical Actions

Heightened scrutiny applies to actions materially affecting direction, resources, or independence:

- Major external engagements or partnerships
- Significant time, money, or personnel commitments
- Activities exceeding defined resource limits
- Mergers, consolidations, acquisitions, or asset sales
- Fundamental research direction changes
- Ethical posture changes
- Ownership or governance changes weakening mission protections

No such action proceeds unless it satisfies the Mission Alignment Standard.

External Engagements

External relationships are permitted only if they:

- Advance or support the laboratory's mission
- Preserve academic primacy

- Fit within available time and resources
- Avoid inappropriate dependence
- Maintain research independence
- Remain ethical and sustainable
- Leave capacity for academic work and preliminary research

Opportunities may be declined if poorly timed, overly demanding, or inconsistent with current purpose.

Governance

The Charter operates as a higher-order instrument, supplementing the Operating Agreement, Members Rights Agreement, and Bylaws, controlling where those documents permit actions conflicting with the laboratory's mission. It binds current and future Members, Managers, successors, and assigns.

Amendment

Amendments require a written instrument signed by the Sole Member (or all Members if multiple). Amendments must expressly state intent to strengthen or maintain mission alignment. Protections governing academic time, resource limits, academic primacy, strategic autonomy, operational independence, and mission-critical decisions may not be weakened, diluted, or removed. Restrictions are permanent and irrevocable.

Ingenuity Laboratory exists to pursue discovery and invention with discipline, independence, and integrity—without sacrificing the academic foundation on which its future depends.
